
Tableau - Histogram

- A histogram represents the frequencies of values of a variable bucketed into ranges.
- Histogram is similar to bar chart but it groups the values into continuous ranges.
- Each bar in histogram represents the height of the number of values present in that range.
- Tableau creates a histogram by taking one measure.
- It creates an additional bin field for the measure used in creating a histogram.

Purpose of Tableau - Histogram

- A histogram is used to summarize discrete or continuous data.
- In other words, it provides a visual interpretation of numerical data by showing the number of data points that fall within a specified range of values (called "bins").

Creating a Histogram

- Using the Sample-superstore, plan to find the quantities of sales for different regions.
- To achieve this, drag the Measure named Quantity to the Rows shelf.
- Then open Show Me and select the Histogram chart.
- The following diagram shows the chart created.
- It shows the quantities automatically bucketed into values ranging from 0 to 4811 and divided into 12 bins.

Creating a Histogram with Dimension

- You can also add Dimensions to Measures to create histograms.
- This will create a stacked histogram.
- Each bar will have stacks representing the values of the dimension.
- Following the steps of the above example, add the Region Dimension to the color Shelf under Marks Card.
- This creates the following histogram where each bar also includes the visualization for different regions.
